Halbert GW, Owens MD, Baillie 9

WPI; 1998-230637/20.

Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells that express this receptor.

Claim 12; Page 52; 73pp; English.

RESULT 1
AAWS7204
ID AAWS7204
AC AAWS7204 The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKKNKHRH (1) or TTRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring,

The invention relates to peptides having affinity for oxidised low density lipoprotein (oxLDL), in cyclised or multimeric form. The peptide concerning the amount of antibodies in a sample, having affinity for oxLDL. The peptide contributes for oxLDL in a sample, having affinity for oxLDL. The peptide contributes for oxLDL in a sample, especially a serum or plasma sample contributes for oxLDL in a sample, especially a serum or plasma sample contributes pre-eclamating the risk of coronary heart diseases, and several other discorders such as contributed in the invention of the invention is stable, can be compared as a long half-life. The present sequence is human apoB-100 cond. And has a long half-life. The present sequence is human apoB-100 cond.

The peptide is useful in an immunoassay to determine the presence, and optionally, the amount of antibodies in a sample, having affinity for oxLDL. Preferably immobilised peptide is useful for measuring the amount of autoantibodies for oxLDL in a sample, especially a serum or plasma sample from a patient for evaluating the risk of coronary heart diseases, other cardiovascular diseases, and several other disorders such as periaorritis, pre-eclampsia, non-insulin-dependent diabetes and endothelial dysfunction. The peptide of the invention is stable, can be synthesised easily without the need to isolate proteins from a patient's blood, and has a long half-life. The present sequence is human apoB-100 derived peptide p244 used in the invention
                                                                                                                          Human apolipoprotein B-100; apoB-100; very-low density lipoprotein; Wa apolipoprotein; binding; in vivo transport; nucleic acid; binding dom nuclear localisation sequence; gene therapy; cancer; cystic fibrosis; non-small cell lung carcinoma; diabetes; arteriosclerosis.
                                                                                                                                                                                                        Nucleic acid binding domain from apoB-100.

ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein (IDL), low density lipoproteins (VLDL) and lipoprotein a. The present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in vivo or in vitro, for expressing a therapeutc polypeptide or antisense molecule (or ribozyme). Specifically they are used for gene therapy of cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
                                                                                                                                                                                                                                                   Anti-coagulant; apolipoprotein B-100; apoB-100; metastatic spread; thromboplastin-mediated process; cancer; inhibitor; blood coagulation; anglogenesis; cellular differentiation; apoptosis; KRAD-14; prothrombinase complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

Peptide fragments of apo:lipo:protein B-100 with anticoagulant activity

WPI; 1998-008798/01.

Claim

60pp; English.

for treating or prev differentiation and

preventing coagulation, inhibiting angiogenesis, and apoptosis.

CC The present sequence is that of human apolipoprotein B. This non-cell CC associated protein is one of a set of proteins characterised as CC diagnostic targets for hepatocellular carcinoma (HCC). Such proteins are tumour samples for hepaticist cylus (HCV) infected parients with HCC as certain specifically up-regulated in HCC tumour tissue when compared to HCC cas frected cirrhotic non-tumour tissue and normal liver. The invention CC relates to the detection of HCC by assaying patient samples such as CC related proteins. A finding of elevated levels of one or more of these can scanning methods that employ non-cell-associated and cell-associated CC related proteins. A finding of elevated levels of one or more of these cand scanning methods that employ non-cell-associated and cell-associated CC related proteins.

ApoB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density lipoprotein sequence can be used in the composition of the invention. The present apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to entaryotic cells, in cancers (particularly non-small cell lung carcinoma), diabetes, Cystic fibronsis and artericallarly non-small cell lung carcinoma), diabetes, Cystic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 394 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Local

This sequence is an example of the peptide of the invention. It has the CC formula (I), or their variants with one or more internal deletions, consertions or substitutions, while retaining anti-coagulant properties of CC apolipoprotein B-100 (apoB-100). Z1-KAO-XI-KKNKHHHS-X-T-Z2 (I) X1 = S or CC (aa), Z2 = the C terminus of the peptide, or 1-47 amino acids compositions containing the peptide, a terminual amide group or 1-77 case. Compositions containing the peptide are used for simultaneous, contestatic sparead. They are also used to inhibit thromboplastin-mediated during or after surgery or in cases of heart attack, stroke etc.) and to combine the peptide as such or as part of a 98-aa peptide, inhibits angiogenesis, cellular differentiation or apoptosis. KRAD-14, contestation of the prothrombinase complex; and prevents activation of the surface of thromboplastin and of platelets by thrombin. Smaller than apoB-100, they act more quickly.

                            This invention describes a novel method for the genetic treatment of hyperlipidemia by altering genes, in hepatocytes, for apoprotein (apo) B, E or Al. Low density lipoprotein (LDL) levels in the blood are reduced by altering an apo B gene (I) in a hepatocyte. The invention describes a method for the therapeutic and/or prophylactic method involving altering an apo B gene in hepatocytes by introducing the mutations Argi12Cys, Argi58Cys or Cysi58Arg and a method for ameliorating atheroscierosis by altering the apo Al gene in a hepatocyte so that the altered protein can dimerize. Altering expression of apo genes regulates levels of high and low density lipoprotein cholesterol. Altering expression of apo B, E and Al genes is used to treat or prevent atherosclerosis, coronary heart disease, Alzheimer's disease, hypobetalipoproteinemia, and dysbetalipoproteinemia. This sequence represents a fragment of the human Apo B protein described in the method of the invention
                                                                                                                                                                                                                                                                                       Claim 4; Page

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ş
                                 CC This sequence represents the human apoliporptoein B-100 (apoB-100). CC Fragments of this sequence can be used in the poptide of the invention, cc which has the formula (I), or their variants with one or more internal CC deletions, insertions or substitutions, while retaining anti-coagulant CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, and the peptide are used for CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, and the middle or sequential treatment of cancer, particularly to prevent metastatic spread. They are also used to inhibit thromboplastin.

CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, stroke etc.)

CC (I); X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, inhibits of inhibit angiogenesis, cellular differentiation or apoptosis. KRAD-CC (I); which is active as such or as part of a 98-aa peptide, inhibits of activation of the prothrombinase complex; and prevents activation of the prothrombinase complex; and prevents activation of the prothrombinase complex; and of platelets by thromboplastin and of platelets by thromboplastin and of platelets by thromboplastin shaller than apoB-100, they act more quickly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

CC The invention relates to a method of inhibiting infection of a cell by cirus capable of forming a complex with lipoprotein. The method comprises of prevent its interaction with cell receptor (Preventing formation of and altering conformation of the complex to compress to interaction with cell receptor (Preventing CR using CR antibody to receptor or binding of lipoprotein complex to CR using CR complex to creativity of cells. In this method, inhibition of infection complex between the lipoprotein complex between the lipoprotein and dissociating the virus and lipoprotein, or by introducing of a virus, and dissociating the virus and lipoprotein, or by introducing of a virus-lipoprotein complex. Alternatively, the method involves preventing formation of a complex between the lipoprotein and complex which binds to an epitope included in the ligand binding domain of change conformational change conformation of a complex between the lipoprotein and complex which binds to an epitope included in the ligand binding domain of complex activity of the binds to an epitope included in the ligand binding domain of apoBl00, or anti-complex which binds to an epitope included in LDL receptor binding complex binding domain of apoBl00, or anti-complex with binds to an epitope included in LDL receptor binding complex binding domain of apoBl00, or anti-complex with binds to the receptor binding domain of apoBl00, or anti-complex with binds to the receptor binding domain of apoBl00, or anti-complex with LDL or the receptor binding domain of apoBl00.

CC viruses that complex with LDL or preventing infection of a cell by individual and the complex with LDL or preventing infection of a cell by individual and complex with LDL or very low-density lipoprotein (VLDL). The metabolism. The present sequence represents apollipoprotein Bl00 (apoBl00)

                                                                                                                                                                   The invention discloses a composition comprising two or more isolated rat CC or human polynucleotides or a polynucleotide which represents a fragment, CC derivative or allelic variation of the nucleic acid sequence. Also CC claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a CC kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal CC subjected to pain, a method for identifying a agent CC compound that regulates the expression of the polynucleotide sequence the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating compound that regulates the activity of one or more of the specification, a method for identifying a compound useful in treating compound that regulates the contivity in an animal of one or more of the polypoptides given in the compound a pharmaceutical composition comprising the one or more compound that restriction composition comprising the one or more compound that set activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction contrivity is useful for preparing a medicament for treating contributes of the specification which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed contribution of this patent did not form directly from WIPO at the first animal contribution of the specification, but was obtained in electronic form directly from WIPO at the first animal contribution of the specification and specification of the specification

                                                                                                                                                                                                 Best Local Similarity
                                                                                                                                                                                                                                                                           The invention comprises methods of detecting the presence or absence of at least one allelic variant of a polymorphic region of a gene associated with cardiovascular disease. The invention specifically relates to detecting the region of a cytochrome C oxidase subunit VIb (COX6B) gene that is associated with high serum cholesterol, or the region of the N-acetylglucosaminyl transferase component glycosylphosphatidylinosicol-1 (GPI-1) gene that is associated with low serum high density lipoprotein (HDL). The methods of the invention are useful for detecting a predisposition to high serum cholesterol, low serum HDL and cardiovascular disease. The methods are also useful for elucidating pathological pathways, developing diagnostic assays and new drug therapies for such disorders. The present amino acid sequence represents a human protein that is associated with high serum cholesterol, low serum HDL and/or cardiovascular disease
                                                                                                                                                                                                                                               Sequence 4563
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; gene therapy; single nucleotide polymorphism; SNP; cytochrome C oxidase subunit VIb; COX6B; high serum cholesterol; GPI-1; N-acetylglucosaminyl transferase component; cardiovascular disease; HDL; glycosylphosphatidylinositol-1; low serum high density lipoprotein.

CC Inength that is targeted to a novel compound that is 8-50 nucleotides in CC length that is targeted to a nucleic acid molecule encoding CC applipoprotein B (ApoB), and specifically hybridises with and inhibits CC specifically hybridises with at least an 8-nucleotide portion of an anchoric acid molecule encoding ApoB; or which CC active site on a nucleic acid molecule encoding ApoB; or which CC antention has antilipaemic, antiarteriosclerotic, antidiabetic, and cardiovascular activity. The compound of the CC anorectic, and cardiovascular activity. The compound may have a use in CC gene therapy. The antisense oligonucleotide is useful for treating an condition involving abnormal lipid metabolism, a condition involving an abnormal lipid metabolism, a condition involving CC abnormal metabolism, atherosclerosis, or a condition (CC specifically Type 2 diabetes), obesity, atherosclerosis or coligonucleotide is also useful for modulating glucose levels (particularly plasma or serum glucose levels) in a human or diabetic (specifically VLDL, hDL) or serum triglyceride levels, lipoprotein levels (correventing or delaying the onset of a disease or condition associated for modulating or the onset of an increase in glucose levels in the animal or the anisociated for human. The present sequence is used in the exemplification of the

The present sequence represents a specifically claimed Apo B binding site peptide which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKONKHRH (1) or TRAITERRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring,

Non-natural lipid particle comprising peptide binding to apo B protein receptor - useful as, e.g. vector for delivering drugs to cancer cells

WPI; 1998-230637/20.

CC The present sequence represents a specifically claimed Apo B 100 binding CC site peptide analogue which can be used as a component of a non-cc particle of the present invention. The LDL particle comprises at least 1 creeptor and at least 1 lipophilic substituent. Also described in the CC invention are peptides containing an apo B binding sequence with at least 1 CC dimers. Non-naturally occurring, receptor-competent LDL particles with sequences: KAEYKUNKHHH (1) or TTRLTRKRGLK (2), or their CC dimers. Non-naturally occurring, receptor-competent LDL particles are CC cancer cells that express an apo B protein receptor, and (ii) additives cell culture media especially as growth supplements. Non-naturally cc occurring, receptor-competents. On additives of a sequence, which is large and tends to aggregate, to provide binding a finity to an apo B protein receptor, and (ii) additives are CC afo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś

AAW96878-97 represent nuclear localisation signal sequence derived from human apolipoprotein B-100 (appB-100). AppB-100 is a major apoprotein component of very-low density lipoproteins (VLDL), intermediate density present sequence can be used in the composition of the invention. The specification describes a composition that comprises LDL and lipoprotein a. The apolipoproteins for the binding and in vivo transport of nucleic acids. The composition is used to deliver nucleic acids to eukaryotic cells, in cancers (particularly non-small cell lung carcinoma), diabetes, cystic fibrosis and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a specifically claimed Apo B 100 binding CC site peptide analogue which can be used as a component of a non-naturally occurring, receptor-competent low density lipoprotein (LDL) CC particle of the present invention. The LDL particle comprises at least 1 cc peptide component that has at least 1 binding site for an apo B protein CC receptor and at least 1 lipophilic substituent. Also described in the CC invention are peptides containing an apo B binding sequence with at least CC 10% identity with sequences: KABYKKNKHRH (1) or TRILTREGIK (2), or their CC dimers. Non-naturally occurring, receptor-competent LDL particles are CC useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives CC concercell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete caffilty to an apo B protein receptor, and (ii) additives concurring, receptor-competent LDL particles do not require the complete caffilty to an apo B protein receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

The present sequence represents a specifically claimed Apo B 100 binding CC site peptide analogue which can be used as a component of a non-competent low density lipoprotein (LDL) CC particle of the present invention. The LDL particle comprises at least 1 creeptor and at least 1 lipophilic substituent. Also described in the CC invention are peptides containing an apo B binding sequence with at least 1 CC dimers. Non-naturally occurring, receptor-competent LDL particles are ccc useful as: (i) drug-targeting vectors for delivering anticancer drugs to CC cancer cells that express an apo B protein receptor, and (ii) additives and ccll culture media especially as growth supplements. Non-naturally cccurring, receptor, and (ii) additives are CC cocurring, receptor-competent LDL particles are ccll culture media especially as growth supplements. Non-naturally cccurring, receptor-competent LDL particles do not require the complete cc apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor.
                                                                                                                                                                          18-JUL-2000; 2000GB-00017641.

The invention relates to peptides having affinity for oxidised low density lipoprotein (oxLDL), in cyclised or multimeric form. The peptide consists of antibodies in a sample, having affinity for oxLDL. The peptide constitution of the peptide is useful for measuring the amount of antibodies in a sample, having affinity for oxLDL. The peptide is useful for measuring the amount of constitution of the amount of the amount of the constitution of
